     The present invention describes enzymatic nucleic acid molecules with RNA CC cleaving activity, which specifically cleave RNA encoded by an aryl CC hydrocarbon nuclear transporter (ARNT) gene, an integrin subunit beta 3 CC gene, an integrin alpha 6 subunit gene, or a fie-2 gene. AAA16775 to AAA17167 and AAA17561 to AAA17622 represent ribozyme sequences for ARNT, CC and AAA17168 to AAA17562 to AAA17684 represent their CC corresponding target sequences, AAA17685 to AAA18985 and AAA19087 to CC AAA19154 represent ribozyme sequences for Tie-2, and AAA19087 to CC aAA19154 represent ribozyme sequences for Tie-2, and AAA19086 CC and AAA19155 to AAA12922 represent their corresponding target sequences; CC AAA19223 to AAA21861 and AAA21501 to AAA21595 represent ribozyme CC sequences for integrin alpha 6 subunit, and AAA23362 to AAA21500 and CC aAA21589 to AAA21688 represent their corresponding target sequences; CC AAA21589 to AAA22468 represent their corresponding target sequence CC aAA21589 to AAA22475 and AAA23263 to AAA2342 represent ribozyme sequence CC aAA21689 to AAA22475 and AAA23263 to AAA2362, AAA23343 to CC AAA23422 represent their corresponding target sequences; CC AAA21689 to AAA22475 and AAA23263 to AAA23462, AAA23343 to CC AAA23422 represent their corresponding target sequences. The ribozymes of CC integrin subunit beta 3, and AAA22476 to AAA23262, AAA23343 to CC CC AAA2342 represent their corresponding target sequences. The ribozymes of CC integrin subunit beta 3, and AAA23476 to AAA23476, AAA23343 to CC CC AAA2342 represent their corresponding target sequences. The ribozymes of CC aAA2342 represent their corresponding target sequences. The ribozymes of CC aAA2342 represent their corresponding target sequences. The ribozymes of CC aAA2342 represent their corresponding target sequences. The ribozymes of CC aAA2342 represent their corresponding target sequences. The ribozymes of CC aAA2343 represent their corresponding target sequences. The ribozymes of CC aAA23434 represent their corresponding target sequenc
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   RESULT 2182
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         និនិនិនិនិនិ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  RESULT 2183
          with a target sequence and contain at least one phosphoro(di)thioate clink, having endonuclease activity. (A), and more generally any catalytic nucleic acid (A') that modulates expression of the oestrogen receptor gene, are used to treat cancer (particularly of breast or endometrium), compared to the conditions associated with levels of oestrogen receptor. CC for other conditions associated with levels of oestrogen receptor. CC Because of the high selectivity for targeted RNA, (A) can also be used to correlate inhibition of gene expression with alterations in phenotype, particularly for identification of therapeutic targets, and as research creagents (for RNA, in the same way that restriction endonucleases are used with DNA). The combination of modifications in (A) improves represent oestrogen receptor hairpin thozyme sequences, and AAA24748 to AAA25992 represent their corresponding target sequences. AAA24748 to AAA25902 represent their corresponding target sequences. AAA25993 to AAA26105 represent oestrogen receptor hairpin ribozyme sequences. CC sequences, and AAA26107 to AAA26218 represent their corresponding target sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present invention relates to enzymatic and antisense nucleic acid molecules that act as inhibitors of the expression of repressor genes encoding the TR2 Orphan receptor, EAR3/COUP-TF-1, the GATA transcription factor gene, IRF-2 and/or the CAATT Displacement protein (CDP). Inhibition of the repressors removes prevents inhibition (and consequently increases expression of) genes involved in the production of erythropoietin, granulocyte colony stimulating factor protein and

This is one of a set of oligonucleotides (see ABA91527-30) used to assess the minimum number of ribonucleotides in DNA-RNA chimeric oligonucleotides required for RNase H cleavage. Each oligonucleotide of the set had a different number of ribonucleotides, 1 in the present case. The oligonucleotides were mixed with target DNA oligonucleotide AGT02009 (see ABA91531) and incubated with target DNA oligonucleotide AGT02009 minutes. The results showed that 4 ribonucleotides were the minimum number for RNA cleavage. The invention provides probes for nucleic acid hybridisation. The probes form a halipin structure comprising a double-stranded stem and a single-stranded loop, and are capable of both intramolecular and intermolecular hybridisation. The double-stranded stem may comprise a methylphosphonate DNA-RNA hybrid that is resistant to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Sequence 17 BP; 1 A; 0 C; 0
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             RNASE H cleavage. When the probe hybridises with a target DNA, the RNA strand in the DNA:RNA duplex becomes sensitive to RNase H treatment and can be removed. Arrays and methods for nucleic acid hybridisation using

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   뮺
CC The invention relates to a method for predicting an individual's charapeutic response to the administration of interferon-alpha-2b and CC ribavirin for the treatment of a pathological condition, especially CC hepatitis C virus (HCV) infection. The method involves determining which CC allelic form is present at positions -3575, -2763, -1082, -819 and -592 CC of the interleukin-10 (IL-10) regulatory region, and comparing these with CC the allelic forms at these positions which are associated with a known cutcome of interferon-alpha-2b and ribavirin administration. Presence of the single nucleotide polymorphisms -592A and -819T, the -592A/A or -CC 819T/T genotypes, the combination of -592A/-819T as a haplotype, or possession of the (108)TCATA haplotype (encompassing positions -3575, -2763, -1082, -CC 919 and -592) is associated with a sustained response to interferon-alpha CC or the (108)TCACC haplotype indicates that the presence of -592C and -819C, cresponsive to this therapy. The method optionally further comprises CC detection of the allele at position -318 of the cytotoxic T-lymphocyte antigen-4 (CTLA-4) promoter and the allele at position 49 of exon 1 of the CTLA-4 gene. The invention also encompasses kits and oligonucleotide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Query Match

The method and primers are useful for identifying and analysing genetic polymorphisms in the IL 10 regulatory region and/or cytotoxic T-lymphocyte antigen-4 which can bused in predicting an individual's response to therapeutic intervention with interferon-alpha-2b and ribavirin for HCV infection, and for predicting the responsiveness of an individual to therapy for a pathological condition, or for predicting the outcome of therapeutic intervention in pathological conditions such as bacterial infection (e.g meningococcal infection), rheumatoid arthritis, systemic lupus erythematosus, Sjogren's syndrome, inflammatory bowel disease or multiple erythematosus, Sjogren's syndrome, inflammatory bowel disease or multiple erythematosus.
given in the specification, a sequence containing at least 15 consecutive nucleotides from the 17 mer sequence, a sequence with, after optimal alignment, at least 80 % identity to the 17 mer sequence, a sequence that hybridizes to them under highly stringent conditions, or the complement of any of them, or the corresponding RNA. The novel isolated nucleic acids of the invention are useful as probes and primers for detecting, identifying, quantifying and/or amplifying a nucleic acid, e.g. as one component of a gene chip, in vitro as (anti) sense reagents, and for production of recombinant polypeptides. Any of the nucleic containing the polypeptides, vectors containing the nucleic acids, cells containing the vector or antibodies directed against the polypeptides are useful for preparation of pharmaceuticals for prevention and/or treatment of viral
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   erythematosus, Sjogren's symmum, .... the invention. sclerosis. The present sequence is related to the invention.

The invention relates to a novel isolated 17 mer nucleic acid sequence, containing at least 15 consecutive nucleotides from the 17 mer sequence, a sequence with, after optimal clasment, at least 80 % identity to the 17 mer sequence, a sequence that hybridizes to them under highly stringent conditions, or the complement of any of them, or the corresponding RNA. The novel isolated nucleic acids of the invention are useful as probes and primers for detecting, identifying, quantifying and/or amplifying a nucleic acid, e.g. as one component of a gene chip, in vitro as (antil sense reagents, and for production of recombinant polypeptides. Any of the nucleic acids, polypeptides, vectors containing the nucleic acids, cells containing the polypeptides are useful for preparation of pharmaceuticals for prevention and/or treatment of viral diseases that are characterised by development of tumours or cell degeneration, specifically cancer but also Alzheimer's disease and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Query Match

Analysis of the expression of the 17 mer nucleic acids in patient samples is useful for diagnosis and/or prognosis of these diseases. The polypeptides can also be used to generate antibodies, and both the polypeptide and antibodies are useful as components of protein chips. The nucleic acid sequences of the invention can be used in gene therapy. This polynucleotide sequence represents a tumour suppression related human fukutin oligonucleotide of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              antisense; sens

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Ś
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     នននិននិនិនិន
                    cc given in the specification, a sequence containing at least 15 consecutive cnucleotides from the 17 mer sequence with, after optimal calignment, at least 80 % identity to the 17 mer sequence, a sequence that the hybridizes to them under highly stringent conditions, or the complement configuration of the invention are useful as probes and primers for detecting, cards of the invention are useful as probes and primers for detecting, conditions, quantifying and/or amplifying a mucleic acid, e.g. as one component of a gene chip, in vitro as (anti)sense reagents, and for production of recombinant polypeptides. Any of the nucleic acids, colls containing the vector or antibodies directed against the polypeptides are useful for vector or antibodies directed against the polypeptides are useful for preparation of pharmaceuticals for prevention and/or treatment of viral cdiscophrenia. Analysis of the expression of the 17 mer nucleic acids in Schizophrenia. Analysis of the expression of the 17 mer nucleic acids in the containing is negative for discoperation of these
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Query Match
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       patient samples is useful for diagnosis and/or prognosis of these diseases. The polypeptides can also be used to generate antibodies, and both the polypeptide and antibodies are useful as components of protein chips. The nucleic acid sequences of the invention can be used in gene therapy. This polymucleotide sequence represents a tumour suppression related human fukutin oligonucleotide of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New isolated nucleic acid, useful for treating viral diseases with tumors and cell degeneration, also related polypeptides, and transfected cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Sequence 17 BP; 4 A; 5 C; 4 G; 4 T; 0 U; 0 Other;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to a novel isolated 17 mer nucleic acid sequence, given in the specification, a sequence containing at least 15 consecutive
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Disclosure; Page 255; 720pp; French.

The invention relates to a novel isolated 17 mer nucleic acid sequence, cc given in the specification, a sequence containing at least 15 consecutive nucleotides from the 17 mer sequence with, after optimal cc alignment, at least 80 % identity to the 17 mer sequence with, after optimal cc hybridizes to them under highly stringent conditions, or the complement cc fany of them, or the corresponding RNA. The novel isolated nucleic acids of the invention are useful as probes and primers for detecting, cc identifying, quantifying and/or amplifying a nucleic acid, e.g. as one component of a gene chip, in vitro as (anti)sense reagents, and for cc production of recombinant polypeptides. Any of the nucleic acids, colypeptides, vectors containing the mucleic acids, cells containing the vector or antibodies directed against the polypeptides are useful for cc preparation of pharmaceuticals for prevention and/or treatment of viral diseases that are characterised by development of tumours or cell containing the acids and protein smples is useful for diagnosis and/or prognosis of these cc diseases. The polypeptides can also be used to generate antibodies, and both the polypeptide and antibodies are useful as components of protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Matches

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ន្តន្តន្តន្ត
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             RESULT 2194
CC given in the specification, a sequence with, after optimal CC nucleotides from the 17 mer sequence, a sequence with, after optimal CC alignment, at least 80 % identity to the 17 mer sequence, a sequence that CC hybridizes to them under highly stringent conditions, or the complement CC of any of them, or the corresponding RNA. The novel isolated nucleic CC acids of the invention are useful as probes and primers for detecting, CC identifying, quantifying and/or amplifying a nucleic acid, e.g. as one CC component of a gene chip, in vitro as (anti) sense reagents, and for CC production of recombinant polypeptides. Any of the nucleic acids, the corresponding the nucleic acids, cells containing the corresponding to the corresponding to the corresponding to the corresponding to the polypeptides are useful for CC preparation of pharmaceuticals for prevention and/or treatment of viral CC diseases that are characterised by development of tumours or cell CC diseases that are characterised by development of the corresponding in the polypeptides and antibodies and/or prognosis of these and CC both the polypeptides can also be used to generate antibodies, and CC therapy. This polynucleotide sequence of the invention can be used in gene CC therapy. This polynucleotide sequence represents a tumour suppression
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            chips. The nucleic acid sequences of the invention can be used in therapy. This polynucleotide sequence represents a tumour suppress related human fukutin oligonucleotide of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Sequence 17 BP; 2 A; 7 C; 3 G; 5 T; 0 U; 0 Other;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  8
The invention relates to a novel isolated 17 mer nucleic acid sequence, CC given in the specification, a sequence containing at least 15 consecutive CC nucleotides from the 17 mer sequence, a sequence with, after optimal CC alignment, at least 80 % identity to the 17 mer sequence, a sequence that conditions, or the complement CC hybridizes to them under highly stringent conditions, or the complement CC acids of the invention are useful as probes and primers for detecting, CC identifying, quantifying and/or amplifying a nucleic acid, e.g. as one CC component of a gene chip, in vitro as (anti)sense reagents, and for production of recombinant polypeptides. Any of the nucleic acids, CC polypeptides, vectors containing the nucleic acids, cells containing the vector or antibodies directed against the polypeptides are useful for CC preparation of pharmaceuticals for prevention and/or treatment of viral CC diseases that are characterised by development of tumours or cell cegeneration, specifically cancer but also Alzheimer's disease and CC diseases. The polypeptides can also be used to generate antibodies, and containing the polypeptide and antibodies are useful as components of these containing chips. The nucleic acid sequences of the invention can be used in gene characterised by development of tumours or cell containing the 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Š
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 S
                          consider the specification, a sequence containing at least 15 consecutive muleotides from the 17 mer sequence, a sequence with, after optimal calignment, at least 80 % identity to the 17 mer sequence, a sequence that thybridizes to them under highly stringent conditions, or the complement cof any of them, or the corresponding RNA. The novel isolated nucleic cards of the invention are useful as probes and primers for detecting, identifying, quantifying and/or amplifying a nucleic acid, e.g. as one component of a gene chip, in vitro as (anti)sense reagents, and for production of recombinant polypeptides. Any of the nucleic acids, cells containing the vector or antibodies directed against the polypeptides are useful for preparation of pharmaceuticals for prevention and/or treatment of viral diseases that are characterised by development of tunours or cell diseases that are characterised by development of tunours or cell contains separate and second or the semples is useful for diagnosis and/or prognosis of these contains the polypeptides can also be used to generate antibodies, and contains. The polypeptide and antibodies are useful as components of these chips. The nucleic acid sequences of the invention can be used in gene chips. This polymucleotide sequence represents a tumour suppression contains of the invention can be used in gene thoragon. This polymucleotide sequence represents a tumour suppression contains of the invention can be used in gene there are the sequence of the invention can be used in gene contains.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     RESULT 2197
                         Cg given in the specification, a sequence containing at least 15 consecutive curve nucleotides from the 17 mer sequence, a sequence with, after optimal CC alignment, at least 80 % identity to the 17 mer sequence, a sequence that CC hybridizes to them under highly stringent conditions, or the complement CC acids of the invention are useful as probes and primers for detecting, acids of the invention are useful as probes and primers for detecting, CC identifying, quantifying and/or amplifying a nucleic acid, e.g. as one CC component of a gene chip, in vitro as (anti)sense reagents, and for CC production of recombinant polypeptides. Any of the nucleic acids, polypeptides, vectors containing the nucleic acids, cells containing the vector or antibodies directed against the polypeptides are useful for CC preparation of pharmaceuticals for prevention and/or treatment of viral CC diseases that are characterised by development of tumours or cell CC diseases that are characterised by development of tumours or cell CC diseases. The polypeptides can also be used to generate antibodies, and CC diseases. The polypeptides can also be used to generate antibodies, and CC diseases. The polypeptides can also be used to generate antibodies, and CC chips. The nucleic acid sequences of the invention can be used in gene CC therapy. This polynucleotide sequence represents a tumour suppression cC related human fukutin oligonucleotide of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Matches
                                                                                                                                                                       given in the specification, a sequence containing at least 15 consecutive nucleotides from the 17 mer sequence, a sequence with after optimal alignment, at least 80 % identity to the 17 mer sequence, a sequence that hybridizes to them under highly stringent conditions, or the complement of any of them, or the corresponding RNA. The novel isolated nucleic acids of the invention are useful as probes and primers for detecting, identifying, quantifying and/or amplifying a nucleic acid, e.g. as one component of a gene chip, in vitro as (anti)sense reagents, and for production of recombinant polypeptides. Any of the nucleic acids, polypeptides, vectors containing the nucleic acids, cells containing the vector or antibodies directed against the polypeptides are useful for preparation of pharmaceuticals for prevention and/or treatment of viral diseases that are characterised by development of tumours or cell degeneration. specifically canner but also aliebases and and deceneration.
                             degeneration, specifically cancer but also Alzheimer's disease and schizophrenia. Analysis of the expression of the 17 mer nucleic acids in patient samples is useful for diagnosis and/or prognosis of these diseases. The polypeptides can also be used to generate antibodies, and both the polypeptide and antibodies are useful as components of protein chips. The nucleic acid sequences of the invention can be used in gene therapy. This polynucleotide sequence represents a tumour suppression related human fukutin oligonucleotide of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               schizophrenia; protein chip; gene therapy; tumour suppression; human fukutin; ds.

                                                                                                                                                The invention relates to a novel isolated 17 mer nucleic acid sequence, given in the specification, a sequence containing at least 15 consecutive nucleotides from the 17 mer sequence, a sequence with, after optimal alignment, at least 80 % identity to the 17 mer sequence, a sequence that calignment, at least 80 % identity to the 17 mer sequence, a sequence that hybridizes to them under highly stringent conditions, or the complement cof any of them, or the corresponding RNA. The novel isolated nucleic cacids of the invention are useful as probes and primers for detecting, component of a gene chip, in vitro as (anti)sense reagents, and for production of recombinant polypeptides. Any of the nucleic acids, e.g. as one component of a gene chip, in vitro as (anti)sense reagents, and for production of recombinant polypeptides. Any of the nucleic containing the vector or antibodies directed against the polypeptides are useful for preparation of pharmaceuticals for prevention and/or treatment of viral diseases that are characterised by development of tumours or cell diseases that are characterised by development of tumours or cell containing the sequences but also Alzheimer's disease and schizophrenia. Analysis of the expression of the 17 mer nucleic acids in patient samples is useful for diagnosis and/or prognosis of these chips. The nucleic acid sequences of the invention can be used in gene chips. The nucleic acid sequences of the invention can be used in gene chips. The nucleic acid sequences of the invention can be used in gene chips. The nucleic acid sequences of the invention can be used in gene therapy. This polynucleotide sequence represents a tumour suppression

                                        CC given in the specification, a sequence containing at least 15 consecutive controlled in the specification, a sequence with, after optimal califorment, at least 80 % identity to the 17 mer sequence, a sequence that CC hybridizes to them under highly stringent conditions, or the complement CC of any of them, or the corresponding NNA. The novel isolated nucleic acids of the invention are useful as probes and primers for detecting, conditions of a gene chip, in vitro as (anti)sense reagents, and for component of a gene chip, in vitro as (anti)sense reagents, and for component of recombinant polypeptides. Any of the nucleic acids, cells containing the cettor or antibodies directed against the polypeptides are useful for corporation of pharmaceuticals for prevention and/or treatment of viral consenses that are characterised by development of tumours or cell diseases that are characterised by development of tumours or cell containing the subject samples is useful for diagnosis and/or prognosis of these confit tamples is useful for diagnosis and/or prognosis of these confit samples is useful for diagnosis and/or prognosis of these confits. The nucleic acid sequences of the invention can be used in gene chips. The nucleic acid sequences of the invention can be used in gene confit acid sequences of the invention can be used in gene confit acid sequences of the invention can be used in gene confit acid sequences of the invention can be used in gene confit acid sequence of the invention can be used in gene confit acid sequences of the invention can be used in gene confit acid sequence of the invention can be used in gene confit acid sequence of the invention can be used in gene confit acid sequence of the invention can be used in gene confit acid sequence of the invention can be used in gene confit acid sequence of the invention can be used in gene confit acid sequence of the invention can be used in gene confit acid sequence of the invention can be used in gene confit acid sequence of the invention can be used to gene 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New isolated nucleic acid, useful for treating viral diseases associated with tumors and cell degeneration, also related polypeptides, antibodies and transfected cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Cytostatic; virucide; neuroprotective; nootropic; neuroleptic; gene chip; antisense; sense; tumour; cell degeneration; cancer; Alzheimer's disease; schizophrenia; protein chip; gene therapy; tumour suppression; human fukutin; ds.

                                                                                                                                                                                                                               CC The invention relates to a novel isolated 17 mer nucleic acid sequence, cc given in the specification, a sequence containing at least 15 consecutive CC nucleotides from the 17 mer sequence, a sequence with, after optimal CC alignment, at least 80 % identity to the 17 mer sequence that CC hybridizes to them under highly stringent conditions, or the complement CC of any of them, or the corresponding RNA. The novel isolated nucleic CC acids of the invention are useful as probes and primers for detecting, component of a gene chip, in vitro as (anti)sense reagents, and for CC component of a gene chip, in vitro as (anti)sense reagents, and for CC production of recombinant polypeptides. Any of the nucleic acids, containing the vector or antibodies directed against the polypeptides are useful for CC preparation of pharmaceuticals for prevention and/or treatment of viral CC diseases that are characterised by development of tumours or cell degeneration, specifically cancer but also Alzheimer's disease and CC schizophrenia. Analysis of the expression of the 17 mer nucleic acids in patient samples is useful for diagnosis and/or prognosis of these components of these and chips. The nucleic acid sequences of the invention can be used in gene chips. This polypeptides can also be used to generate antibodies, and components of protein containing the invention can be used in gene containing the invention can be used in gene containing the components of the sequences of the invention can be used in gene containing the components of

Creation relates to a novel isolated 17 mer nucleic acid sequence, containing at least 15 consecutive containing to the 17 mer sequence a sequence that containing containing the novel isolated nucleic containing of the invention are useful as probes and primers for detecting, confidentifying, quantifying and/or amplifying a nucleic acid, e.g. as one component of a gene chip, in vitro as (anti)sense reagents, and for component of a gene chip, in vitro as (anti)sense reagents, and for component of recombinant polypeptides. Any of the nucleic acids, containing the vector or antibodies directed against the polypeptides are useful for concervation of pharmaceuticals for prevention and/or treatment of viral conseases that are characterised by development of tumours or cell degeneration, specifically cancer but also Alzheimer's disease and containing the special sequences of the 17 mer nucleic acids in containing the polypeptides can also be used to generate antibodies, and both the polypeptide and antibodies are useful as components of these characterises and also be used to generate antibodies, and containing the polypeptide and antibodies are useful as components of protein containing the polypeptide and antibodies are useful as components of protein contains.

The nucleic acid sequences of the invention can be used in gene containing the containing the used in gene containing the containing the used in gene containing the con

                                                                                                                á
                                      ABT36198
                                                   RESULT 2204
                                                                                                                                                                                                                   The invention relates to a novel isolated 17 mer nucleic acid sequence, cc given in the specification, a sequence containing at least 15 consecutive cnot controlled from the 17 mer sequence, a sequence with, after optimal cc alignment, at least 80 % identity to the 17 mer sequence with, after optimal cc alignment, or them under highly stringent conditions, or the complement cc fany of them, or the corresponding RNA. The novel isolated nucleic acids of the invention are useful as probes and primers for detecting, cc identifying, quantifying and/or amplifying a nucleic acid, e.g. as one cc component of a gene chip, in vitro as (anti)sense reagents, and for production of recombinant polypeptides. Any of the nucleic acids, cc polypeptides, vectors containing the nucleic acids, cells containing the vector or antibodies directed against the polypeptides are useful for creparation of pharmacceuticals for prevention and/or treatment of viral cd diseases that are characterised by development of tumours or cell cd degeneration, specifically cancer but also Alzheimer's disease and cc diseases. The polypeptides can also be used to generate antibodies, and cohit the polypeptide and antibodies are useful as components of these cold sequences of the invention can be used in gene chips. The nucleic acid sequences of the invention can be used in gene cherapy. This polynucleotide sequence represents a tumour suppression cc related human fukutin oligonucleotide of the invention.

(MOLE-) MOLECULAR ENGINES LAB

Telerman A, Amson R, Tuijnder M;

New isolated nucleic acid, useful for treating viral diseases associated with tumors and cell degeneration, also related polypeptides, antibodies and transfected cells.

Disclosure; Page 247; 720pp; French.

The invention relates to a novel isolated 17 mer nucleic acid sequence, containing at least 15 consecutive containing at least 15 containing at conditions, or the complement containing at least 18 containing at least 18 containing at least 18 containing the component of a gene chip, in vitro as (anti)sense reagents, and for component of a gene chip, in vitro as (anti)sense reagents, and for component of a gene chip, in vitro as (anti)sense reagents, and for component of a gene chip, in vitro as (anti)sense reagents, and for component of a gene chip, in vitro as (anti)sense reagents, and for component of pharmaceuticals for prevention and/or treatment of viral containing the vector or antibodies directed against the polypeptides are useful for corporation of pharmaceuticals for prevention and/or treatment of viral conservation, specifically cancer but also Alzheimer's disease and containing the expression of the 17 mer nucleic acids in containing the expression of the 17 mer nucleic acids in containing the expression of the 18 consons and or these containing the expression and or proposed the polypeptides can also be used to generate antibodies, and containing the containing the containing the expression of the seed in gene chips. The nucleic acid sequences of the invention can be used in gene chips. The nucleic acid sequences of the invention can be used in gene chips. The nucleic acid sequences of the invention can be used in gene chips.

Tumour suppression related human fukutin oligo SEQ ID

No 1907

```
The invention relates to a novel isolated 17 mer nucleic acid sequence, cc given in the specification, a sequence containing at least 15 consecutive cnucleotides from the 17 mer sequence, a sequence with, after optimal cc alignment, at least 80 % identity to the 17 mer sequence that cc hybridizes to them under highly stringent conditions, or the complement co f any of them, or the corresponding RNA. The novel isolated nucleic acids of the invention are useful as probes and primers for detecting, cc identifying, quantifying and/or amplifying a nucleic acid, e.g. as one cc component of a gene chip, in vitro as (anti)sense reagents, and for cc production of recombinant polypeptides. Any of the nucleic acids, cc polypeptides, vectors containing the nucleic acids, cells containing the vector or antibodies directed against the polypeptides are useful for cc preparation of pharmaceuticals for prevention and/or treatment of viral cd diseases that are characterised by development of tumours or cell diseases that are characterised by development of tumours or cell contains samples is useful for diagnosis and/or prognosis of these cc diseases. The polypeptides can also be used to generate antibodies, and contains the polypeptide and antibodies are useful as components of these characterises. The nucleic acid sequences of the invention can be used in gene chips. The nucleic acid sequences of the invention can be used in gene characterise and nucleic acid sequences of the invention can be used in gene characterise and nucleic acid sequences of the invention can be used in gene components of these can be used in gene components of these can be used in gene components of these can be used in gene components of the sequences of the invention can be used in gene characterise of the invention can be used in gene components of the invention can be used in gene components of the invention can be used in gene components of the invention can be used in gene components of the invention can be used in gene components of the invention

The invention relates to a novel isolated 17 mer nucleic acid sequence, completed in the specification, a sequence containing at least 15 consecutive nucleotides from the 17 mer sequence with, after optimal calignment, at least 80 % identity to the 17 mer sequence that thybridizes to them under highly stringent conditions, or the complement complete for the invention are useful as probes and primers for detecting, component of a gene chip, in vitro as (anti)sense reagents, and for production of recombinant polypeptides. Any of the nucleic acids, component of a gene chip, in vitro as (anti)sense reagents, and for polypeptides, vectors containing the nucleic acids, cells containing the vector or antibodies directed against the polypeptides are useful for preparation of pharmaceuticals for prevention and/or treatment of viral diseases that are characterised by development of tumours or cell diseases that are characterised by development of tumours or cell contains samples is useful for diagnosis and/or prognosis of these chizophrenia. Analysis of the expression of the 17 mer nucleic acids in patient samples is useful for diagnosis and/or prognosis of these chips. The nucleic acid sequences of the invention can be used in gene therapy. This polymented sequence of the invention can be used in gene characteristic sequences of the invention can be used in gene contained the invention can be used in gene contained the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New isolated nucleic acid, useful for treating viral diseases associated with tumors and cell degeneration, also related polypeptides, antibodies and transfected cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Cytostatic; virucide; neuroprotective; nootropic; neuroleptic; geantisense; sense; tumour; cell degeneration; cancer; Alzheimer's schizophrenia; protein chip; gene therapy; tumour suppression; human fukutin; ds.

                                                                                                                                                                                                                                                                                                                                                                                                 ş
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to a novel isolated 17 mer nucleic acid sequence, cc given in the specification, a sequence containing at least 15 consecutive cc calignment, at least 80 % identity to the 17 mer sequence with, after optimal cc alignment, at least 80 % identity to the 17 mer sequence that cc hybridizes to them under highly stringent conditions, or the complement cc acids of the invention are useful as probes and primers for detecting, cc identifying, quantifying and/or amplifying a nucleic acid, e.g. as one cc component of a gene chip, in vitro as (anti)sense reagents, and for production of recombinant polypeptides. Any of the nucleic acids, containing the vector or antibodies directed against the polypeptides are useful for preparation of pharmaceuticals for prevention and/or treatment of viral cd diseases that are characterised by development of tumours or cell cd degeneration, specifically cancer but also Alzheimer's disease and containing the nucleic acids in sphiophrenia. Analysis of the expression of the 17 mer nucleic acids in containing the polypeptides can also be used to generate antibodies, and containing the patient samples is useful for diagnosis and/or prognosis of these containing chips. The nucleic acid sequences of the invention can be used in gene cc diseases. The polypeptides can also be used to generate antibodies, and containing the polypeptide and antibodies are useful as components of protein containing the polypeptide and antibodies are useful as components of protein containing the polypeptide and antibodies are useful as components of protein containing the polypeptide and antibodies are useful as components of protein containing the polypeptide and antibodies are useful as components of these containing the containing the used in gene containing the containin
                                                                                                                                                                                                                                                          ABT39059

The invention relates to a novel isolated 17 mer nucleic acid sequence, cc given in the specification, a sequence containing at least 15 consecutive nucleotides from the 17 mer sequence, a sequence with, after optimal calignment, at least 80 % identity to the 17 mer sequence, a sequence that hybridizes to them under highly stringent conditions, or the complement conditions of the invention are useful as probes and primers for detecting, cards of the invention are useful as probes and primers for detecting, component of a gene chip, in vitro as (anti) sense reagents, and for production of recombinant polypeptides. Any of the nucleic acid, e.g. as one component of a gene chip, in vitro as (anti) sense reagents, and for production of recombinant polypeptides. Any of the nucleic acids, collagonation of pharmaceuticals for prevention and/or treatment of viral components of pharmaceuticals for prevention and/or treatment of viral containing the containing the containing the containing the prevention, specifically cancer but also Alzheimer's disease and schizophrenia. Analysis of the expression of the 17 mer nucleic acids in patient samples is useful for diagnosis and/or prognosis of these contains. The pulpeptides can also be used to generate antibodies, and contains. The nucleic acid sequences of the invention can be used in gene contains. The polypeptides can also be used to generate antibodies, and the polypeptides and antibodies are useful as components of protein contains. The polypeptide sequence represents a tumour suppression contains and tumour suppression of the contains of protein contains.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New isolated nucleic acid, useful for treating viral diseases associated with tumors and cell degeneration, also related polypeptides, antibodies and transfected cells.

밁

sub-unit modulating inozyme substrate #333.

03-JUN-2003

Enzymatic nucleic acid; nuclear factor kappa B; NFKB; inozyme; zinzyme; G-cleaver; amberzyme; cancer; REL-A activity; breast cancer; human; lung cancer; prostate cancer; colorectal cancer; brain cancer; oesophageal cancer; stomach cancer; bladder cancer; pancreatic cancer; cervical cancer; head and neck cancer;

```
CC regulates expression of a sequence encoding a subunit of nuclear factor (kappa B (NFKB), where (I) is an inozyme, zinzyme, G-cleaver or amberzyme (C confeiguration. The enzymatic nucleic acid molecule is adapted to treat (C cancer and is useful for down-regulating REL-A activity in a cell, for C treating a patient having a condition associated with the level of REL-A. (C (I) is useful for cleaving RNA comprising a sequence of REL-A gene, in C (I) is useful for cation, especially Mg^2+. The enzymatic and C the presence of a divalent cation, especially Mg^2+. The enzymatic and C prostate, colorectal, brain, oesophageal, stomach, bladder, pancreatic, C prostate, colorectal, brain, oesophageal, stomach, bladder, pancreatic, C cervical, head and neck, ovarian cancer, melanoma, lymphoma, glioma or C chemotherapy including paclitaxel, docetexel, cisplatin, methotrexate, C cyclophosphamide, doxorubin, fluorouracil carboplatin, edatrexate, C cyclophosphamide, doxorubin, fluorouracil carboplatin, edatrexate, cardot molecules are also useful for treating inflammatory disease such as a content of the content
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     07-DEC-1992;

human;

Novel enzymatic nucleic acid molecules which down regulates expression a sequence encoding a subunit of nuclear factor kappa B useful for treating cancer, inflammatory disorders and autoimmune diseases.

WPI; 2003-340953/32.

Claim 3; Page 32; 72pp; English.

country utation. The enayments invited motivation is enabled to cancer and is useful for down-regulating REL-A activity in a cell, for classing a patient having a condition associated with the level of REL-A. (I) is useful for cleaving RNA comprising a sequence of REL-A gene, in the presence of a divalent cation, especially Mg^2^+. The enzymatic and contisense nucleic acid molecules are useful for treating breast, lung, prostate, colorectal, brain, oesophageal, stomach, bladder, pancreatic, corvical, head and neck, ovarian cancer, melanoma, lymphoma, glioma or multidrug resistant cancer. The method involves use of other drug charagies such as monoclonal antibodies, REL-A-specific inhibitors or concentration including paclitaxel, docetaxel, cisplatin, methotrexate, cyclophosphamide, doxorubin, fluorouracil carboplatin, edatrexate, cyclophamide, doxorubin, fluorouracil carboplatin, edatrexate, cyclophamide, doxorubin, fluorouracil carboplatin, edatrexate, cyclop The invention describes an enzymatic nucleic acid molecule (I) which down regulates expression of a sequence encoding a subunit of nuclear factor kappa B (NFKB), where (I) is an inozyme, zinzyme, G-cleaver or amberzyme kappa B (NFKB), where (1) is an inozyme, zinzyme, G-cleaver or amberzyn configuration. The enzymatic nucleic acid molecule is adapted to treat down

                                                                                                                                               proteins and their coding sequences: MDZ3, MDZ4, MDZ7, MDZ12. MDZ3 is encoded at chromosome 7q22.1, MDZ4 is encoded at chromosome 6p21.3-22.2, MDZ7 is encoded at chromosome 7p21.3-22.2, MDZ7 is encoded at chromosome fighl.2 and MDZ12 is encoded at chromosome 15q26.1. The MDZ3, MDZ4, MDZ7, and MDZ12 sequences are useful in therapy, or in manufacturing a medicament for treating or preventing a disorder associated with decreased or increased expression or activity of MDZ3, MDZ4, MDZ7, or MDZ12, e.g. cancer or developmental disorders. The nucleic acids and proteins are also useful for diagnosing or monitoring a disease caused by altered expression of MDZ3, MDZ4, MDZ7, or MDZ12. The nucleic acids can also be used as probes to detect and characterize gross alterations in MDZ3, MDZ4, MDZ7, or MDZ12 genetic locus. The probes are
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Sequence 17 BP; 2 A; 9 C; 3 G; 0 T; 3 U; 0 Other;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         nucleic acid molecule
                                                                                              useful in constructing microarrays for measuring gene expression. The proteins are useful as therapeutic agents for gene therapy or as vaccines. The present sequence was used to illustrate the invention.
                                                                                                                                                                                                                                                                                                                                                                                                      New zinc finger-containing proteins and nucleic acids, useful in manufacturing a medicament for treating or preventing a disorder associated with decreased or increased expression or activity of MDZ4, MDZ7 or MDZ12, e.g. cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Cytostatic; immunostimulant; gene therapy; vaccine; human; zinc finger protein; MDZ3; MDZ4; MDZ7; MDZ12; chromosome 7g22.1; chromosome 6p21.3-22.2; chromosome 16p11.2; chromosome 15q26.1;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Human MDZ7 scanning oligonucleotide SEQ ID 5305
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  EP1281758-A2
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     20-NOV-2003
                                                                                                                                                                                                                                                                                                                                         The present invention relates to novel human zinc finger-containing
                                                                                                                                                                                                                                                                                                                                                                         Example 8; SEQ ID NO 5305; 103pp; English.

                                                                      Matches
                                                                                                                                                                                                                          proteins and their coding sequences: MDZ3, MDZ4, MDZ7, MDZ12. MDZ3 is encoded at chromosome 7q22.1, MDZ4 is encoded at chromosome 6p21.3-22.2, MDZ7 is encoded at chromosome 15q26.1. The MDZ3 is encoded at chromosome 15q26.1. The MDZ3, MDZ4, MDZ7, and MDZ12 is encoded at chromosome 15q26.1. The MDZ3, MDZ4, MDZ7, and MDZ12 sequences are useful in therapy, or in manufacturing a medicament for treating or preventing a disorder associated with decreased or increased expression or activity of MDZ3, MDZ4, MDZ7, or MDZ12, e.g. cancer or developmental disorders. The nucleic acids and proteins are also useful for diagnosing or monitoring a disease caused by altered expression of MDZ3, MDZ4, MDZ7, or MDZ12. The nucleic acids can also be used as probes to detect and characterize gross alterations in MDZ3, MDZ4, MDZ7, or MDZ12 genetic locus. The probes are
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Cytostatic; immunostimulant; gene therapy; vaccine; human; zinc finger protein; MDZ3; MDZ4; MDZ7; MDZ12; chromosome 7q22.1; chromosome 6p21.3-22.2; chromosome 15p11.2; chromosome 15q26.1; cancer; developmental disorder; ss.
                                                                                                                                                                        useful in constructing microarrays for measuring gene expression. The proteins are useful as therapeutic agents for gene therapy or as vaccines. The present sequence was used to illustrate the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New zinc finger-containing proteins and nucleic acids, useful manufacturing a medicament for treating or preventing a disorcassociated with decreased or increased expression or activity MDZ4, MDZ7 or MDZ12, e.g. cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Human MDZ7 scanning oligonucleotide SEQ ID

                                                                                                                                                                                                                                                                                                                           PHARM INC.
```

acid molecule of the invention has cytostatic, anti-HIV, and anti-rheumatic activity. The nucleic acid molecules are useful for reducing HER2, K-Ras, H-Ras, and HIV activity in a cell. The nucleic acids are also useful for treating breast, ovarian, colorectal, lung, prostate, bladder, or pancreatic cancer, and HIV infection, and AIDS: The sequences shown in ABZ59889 - ABZ62216, ABZ64544 - ABZ65531, ABZ66520 - ABZ66524, ABZ66530 - ABZ66585 represent substrate/target sequences for the human acid molecule or an enzymatic nucleic acid molecule, that modulates expression of a nucleic acid molecule encoding HER2, K-Ras, H-Ras, N-luman immunodeficiency virus (HIV) or a component of HIV. The nucleic ribozymes of the The invention relates to a novel short interfering RNA (siRNA) nucleic invention N-Ras

treating cancer, modulates the expression of a nucleic acid encoding {\tt HER2}, {\tt K-Ras}, {\tt H-Ras}, {\tt N-Ras}, and human deficiency virus sequences.
                                                                                                             English
```

The invention relates to a novel short interfering RNA (siRNA) nucleic acid molecule or an enzymatic nucleic acid molecule, that modulates expression of a nucleic acid molecule encoding HER2, K-Ras, H-Ras, N-Ras, human immunodeficiency virus (HIV) or a component of HIV. The nucleic acid molecule of the invention has cytostatic, anti-HIV, and anti-rheumatic activity. The nucleic acid molecules are useful for reducing HER2, K-Ras, H-Ras, and HIV activity in a cell. The nucleic acids are also useful for treating breast, ovarian, colorectal, lung, prostate, bladder, or pancreatic cancer, and HIV infection, and AIDS. The sequences shown in AB259899 - AB26216, AB264544 - AB265531, AB266520 - AB266524, Sequence 17 BP; 4 A; 4 C; 4 G; 0 T; 5 U; 0 Other; ribozymes of the invention ABZ66530 - ABZ66585 represent substrate/target sequences for the human

```

The invention relates to a novel short interfering RNA (siRNA) nucleic acid molecule or an enzymatic nucleic acid molecule. That modulates expression of a nucleic acid molecule encoding HER2, K-Ras, H-Ras, N-Ra human immunodeficiency virus (HIV) or a component of HIV. The nucleic

e invention has cytostatic, anti-HIV, anti-HIV

anti-HIV, and anti-

N-Ras,

for reducing

acid molecule of the

Novel short interfering RNA and enzymatic nucleic acid useful for treating cancer, modulates the expression of a nucleic acid encoding HER2, K-Ras, H-Ras, N-Ras, and human deficiency virus sequences.

(RIBO-) RIBOZYME

PHARM INC

HER2, K-Ras, H-Ras, and HIV activity in a cell. The nucleic acids are also useful for treating breast, ovarian, colorectal, lung, prostate, bladder, or pancreatic cancer, and HIV infection, and AIDS. The sequences shown in ABZ59889 - ABZ62216, ABZ64544 - ABZ65520 - ABZ66524, ABZ66530 - ABZ66585 represent substrate/target sequences for the human ribozymes of the invention

                                                              The invention relates to a novel short interfering RNA (siRNA) nucleic acid molecule or an enzymatic nucleic acid molecule, that modulates expression of a nucleic acid molecule encoding HER2, K-Ras, H-Ras, and anti-numan immunodeficiency virus (HIV) or a component of HIV. The nucleic acid molecule of the invention has cytostatic, anti-HIV, and anti-rheumatic activity. The nucleic acid molecules are useful for reducing HER2, K-Ras, H-Ras, and HIV activity in a cell. The nucleic acids are also useful for treating breast, ovarian, colorectal, lung, prostate, bladder, or pancreatic cancer, and HIV infection, and AIDS. The sequences shown in ABZ56530 - ABZ65531, ABZ65531, ABZ66524, ABZ65530 - ABZ65536 represent substrate/target sequences for the human in the colorectal acids are also useful for treating breast, ovarian, colorectal, lung, prostate, bladder, or pancreatic cancer, and HIV infection, and AIDS. The sequences shown in ABZ66530 - ABZ66524, ABZ65531, ABZ66530 - ABZ66524, ABZ66530 - ABZ66538 represent substrate/target sequences for the human in the color of the color of the human in the col

                                                                                                                                        Query Match
                                                                                                                                                                                                                                                       acid molecule or an enzymatic nucleic acid molecule, that modulates expression of a nucleic acid molecule encoding HER2, K-Ras, H-Ras, N-Ras, human immunodeficiency virus (HIV) or a component of HIV. The nucleic acid molecule of the invention has cytostatic, anti-HIV, and anti-rheumatic activity. The nucleic acid molecules are useful for reducing HER2, K-Ras, H-Ras, and HIV activity in a cell. The nucleic acids are also useful for treating breast, ovarian, colorectal, lung, prostate, bladder, or pancreatic cancer, and HIV infection, and AIDS. The sequences shown in ABZ5989 - ABZ62216, ABZ64544 - ABZ65531, ABZ66520 - ABZ66524, ABZ66530 - ABZ66585 represent substrate/target sequences for the human
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human; ribozyme; short interfering RNA; siRNA; HER2; K-Ras; enzymatic nucleic acid; H-Ras; N-Ras; HIV; cytostatic; anti-HIV;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 29-MAY-2001; 2001US-0294140P.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ACC68806), which are associated with tumour suppression, tumour reversion, apoptosis and virus resistance. The oligonucleotides are useful as (1) as probes and primers for detecting, identifying, quantifying and/or amplifying nucleic acid, e.g. as one component of a gene chip; in vitro as (anti)sense reagents; and (2) for production of recombinant polypeptides. The oligonucleotides are useful for preparation of pharmaceuticals for prevention and/or treatment of viral diseases that are characterised by development of tumours or cell degeneration, specifically cancer but also Alzheimer's disease and schizophrenia
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          tumour suppression;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present invention relates to murine oligonucleotides (ACC62754-ACC68806), which are associated with tumour suppression, tumour reversion, apoptosis and virus resistance. The oligonucleotides are useful as (1) as probes and primers for detecting, identifying, quantifying and/or amplifying nucleic acid, e.g. as one component of a gene chip; in viro as (anti) sense reagents; and (2) for production of recombinant polypeptides. The oligonucleotides are useful for preparation of pharmaceuticals for prevention and/or treatment of viral diseases that are characterised by development of tumours or cell degeneration, specifically cancer but also Alzheimer's disease and schizophrenia
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New isolated nucleic acid, useful for treating viral diseases with tumors and cell degeneration, also related polypeptides, and transfected cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                27-MAR-2003

The nucleotides (also vectors containing them and cells containing the vectors), the encoded polypeptides and antibodies (Ab) against the polypeptide are useful for prevention and/or treatment of viral infections or diseases characterized by development of tumours or cell degeneration (e.g. Alzheimer's disease or schizophrenia). Analysis of the expression of the nucleotides can be used for diagnosis and/or prognosis of these diseases. The nucleotides and polypeptides can be used to screen for their specific interactive molecules, potentially useful for treating diseases associated with abnormal
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              fragments of at least 15 consecutive nucleotides of these nucleotides, a sequence having at least 80% identity, after optimal alignment, with the nucleotides, a sequence that hybridizes under stringent conditions with the nucleotides, or the complement, or corresponding RNA, of the nucleotides, or the complement or corresponding RNA, of the nucleotides are used as probes or primers for detecting identifying, quantifying and/or amplifying nucleic acids, as in vitro identifying and or amplifying incleic acids.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Disclosure; Page 540; 771pp; French.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Sequence 17 BP; 4 A;
New nucleic acid encoding human prostate membrane-specific antigen, useful e.g. for treatment of tumors and viral infection, also related polypeptide and antibodies.
                                                                                                                                                                                                                                                                            15-MAY-2003

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to the isolation of 6327 nucleotide sequences, fragments of at least 15 consecutive nucleotides of these nucleotides, a sequence having at least 80% identity, after optimal alignment, with the nucleotides, a sequence that hybridizes under stringent conditions with the mucleotides, or the complement, or corresponding RNA, of the nucleotides. The nucleotides are used as probes or primers for detecting identifying quantifying and/or amplifying nucleic acids, as in vitro sense and antisense sequences, of nucleotides involved in tumour
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     or cell degeneration (e.g. Alzheimer's disease or schizophrenia). Analysis of the expression of the nucleotides can be used for diagnosis and/or prognosis of these diseases. The nucleotides and polypeptides car also be used to screen for their specific interactive molecules, potentially useful for treating diseases associated with abnormal expression of the nucleotides.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      cells containing the vectors), the encoded polypeptides and antibodies (Ab) against the polypeptide are useful for prevention and/or treatment of viral infections or diseases characterized by development of tumours
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      suppression or reversion, apoptosis and or viral resistance, to produce recombinant polypeptides, and to prepare transgenic animals, as experimental models. The nucleotides (also vectors containing them and

```

The invention relates to the isolation of 6327 nucleotide sequences, fragments of at least 15 consecutive nucleotides of these nucleotides, sequence having at least 80% identity, after optimal alignment, with t

with the

The invention relates to the isolation of 6327 nucleotide sequences, if ragments of at least 15 consecutive nucleotides of these nucleotides, a sequence having at least 80% identity, after optimal alignment, with the nucleotides, a sequence that hybridizes under stringent conditions with the nucleotides, or the complement, or corresponding RNA, of the nucleotides. The nucleotides are used as probes or primers for detecting

detecting

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             S
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               cc nucleotides, a sequence that hybridizes under stringent conditions with ct the nucleotides. Or the complement, or corresponding RNA, of the cc nucleotides. The nucleotides are used as probes or primers for detecting, cidentifying, quantifying and/or amplifying nucleic acids, as in vitro cc sense and antisense sequences, of nucleotides involved in tumour cc suppression or reversion, apoptosis and or viral resistance, to produce recombinant polypeptides, and to prepare transgenic animals, as cells containing the vectors, it he encoded polypeptides and antibodies (Ab) against the polypeptide are useful for prevention and/or treatment cc or cell degeneration (e.g. Alzheimer's disease or schizophrenia). Cc Analysis of the expression of the nucleotides can be used for diagnosis can be used to screen for their specific interactive molecules, contentially useful for treating diseases associated with abnormal corrections and contentially useful for treating diseases associated with abnormal
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 identifying, quantifying and/or amplifying nucleic acids, as in vitro sense and antisense sequences, of nucleotides involved in tumour suppression or reversion, apoptosis and or viral resistance, to produce recombinant polypeptides, and to prepare transgenic animals, as experimental models. The nucleotides (also vectors containing them and cells containing the vectors), the encoded polypeptides and antibodies (Ab) against the polypeptide are useful for prevention and/or treatment of viral infections or diseases characterized by development of tumours or cell degeneration (e.g. Alzheimer's disease or schizophrenia). Analysis of the expression of the nucleotides can be used for diagnosis and/or prognosis of these diseases. The nucleotides and polypeptides can also be used to screen for their specific interactive molecules, potentially useful for treating diseases associated with abnormal expression of the molecules associated with abnormal
The invention relates to the isolation of 6327 nucleotide sequences, fragments of at least 15 consecutive nucleotides of these nucleotides, sequence having at least 80% identity, after optimal alignment, with the nucleotides, a sequence that hybridizes under stringent conditions with the nucleotides, or the complement, or corresponding RNA, of the nucleotides. The nucleotides are used as probes or primers for detectin identifying, quantifying and/or amplifying nucleic acids, as in vitro sense and antisense sequences, of nucleotides involved in tumour suppression or reversion, apoptosis and or viral resistance, to produce
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                cytostatic; antiviral; neuroprotective; nootropic; neuroleptic; 88; primer; probe; tumour suppression; tumour reversion; apoptosis; virus resistance; transgenic animals; Alzheimer's disease; schizophrenia;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Sequence 17
                                                                                                                                                                                                                                                                                                                                                       New nucleic acid encoding human prostate membrane-specific antigen, useful e.g. for treatment of tumors and viral infection, also related polypeptide and antibodies.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Tumour suppression/reversion associated nucleotide

```

The invention relates to the isolation of 6327 nucleotide sequences, a fragments of at least 15 consecutive nucleotides of these nucleotides, a sequence having at least 80% identity, after optimal alignment, with the nucleotides, a sequence that hybridizes under stringent conditions with the nucleotides or the complement, or corresponding RNA, of the nucleotides. The nucleotides are used as probes or primers for detecting, identifying, quantifying and/or amplifying nucleic acids, as in vitro sense and antisense sequences, of nucleotides involved in tumour suppression or reversion, apoptosis and or viral resistance, to produce recombinant polypeptides, and to prepare transgenic animals, as experimental models. The nucleotides (also vectors containing them and experimental models. The nucleotides (also vectors containing them and

encoded

vectors containing them and polypeptides and antibodies

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     recombinant polypeptides, and to prepare transgenic animals, as experimental models. The nucleotides (also vectors containing them and cells containing the vectors), the encoded polypeptides and antibodies (Ab) against the polypeptide are useful for prevention and/or treatment of viral infections or diseases characterized by development of tumours or cell degeneration (e.g. Alzheimer's disease or schizophrenia). Analysis of the expression of the nucleotides can be used for diagnosis and/or prognosis of these diseases. The nucleotides and polypeptides can also be used to screen for their specific interactive molecules, potentially useful for treating diseases associated with abnormal expression of the nucleotides.
                                                                                                                                                                                                                                                                                                                                                                                          useful e.g.

                     the nucleotides, or the complement, or corresponding RNA, of the nucleotides. The nucleotides are used as probes or primers for detecting identifying, quantifying and/or amplifying nucleic acids, as in vitro sense and antisense sequences, of nucleotides involved in tumour suppression or reversion, apoptosis and or viral resistance, to produce recombinant polypeptides, and to prepare transgenic animals, as experimental models. The nucleotides (also vectors containing them and cells containing the vectors), the encoded polypeptides and antibodies (Ab) against the polypeptide are useful for prevention and/or treatment of viral infections or diseases characterized by development of tumours
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               of viral infections or diseases characterized by development of tumou or cell degeneration (e.g. Alzheimer's disease or schizophrenia). Analysis of the expression of the nucleotides can be used for diagnos and/or prognosis of these diseases. The nucleotides and polypeptides also be used to screen for their specific interactive molecules, potentially useful for treating diseases associated with abnormal expression of the nucleotides.
                                                                                                                                                                                                                                                                                                                  The invention relates to the isolation of 6327 nucleotide sequences, fragments of at least 15 consecutive nucleotides of these nucleotides, sequence having at least 80% identity, after optimal alignment, with the nucleotides, a sequence that hybridizes under stringent conditions with
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       18-DEC-2003

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          RESULT 2230
                   The invention relates to the isolation of 6327 nucleotide sequences, or fragments of at least 15 consecutive nucleotides of these nucleotides, a gequence having at least 80% identity, after optimal alignment, with the nucleotides, a sequence that hybridizes under stringent conditions with the nucleotides. The nucleotides are used as probes or primers for detecting, cidentifying, quantifying and/or amplifying nucleic acids, as in vitro sense and antisense sequences, of nucleotides involved in tumour suppression or reversion, apoptosis and or viral resistance, to produce recombinant polypeptides, and to prepare transgenic animals, as containing the vectors), the encoded polypeptides and antibodies (also vectors containing them and cells containing the vectors), the encoded polypeptides and antibodies ((Ab) against the polypeptide are useful for prevention and/or treatment of viral infections or diseases characterized by development of tumours or cell degeneration (e.g. Alzheimer's disease or schizophrenia).

CC analysis of the expression of the nucleotides can be used for diagnosis and/or prognosis of these diseases. The nucleotides can be used for diagnosis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Query Match

                                                 The invention relates to the isolation of 6327 nucleotide sequences, and consequence having at least 15 consecutive nucleotides of these nucleotides, a sequence that hybridizes under stringent conditions with the culleotides, a sequence that hybridizes under stringent conditions with the nucleotides. The nucleotides are used as probes or primers for detecting, identifying, quantifying and/or amplifying nucleic acids, as in vitro sense and antisense sequences, of nucleotides involved in tumour cultivatives and to prepare transgenic animals, as suppression or reversion, apoptosis and or viral resistance, to produce recombinant polypeptides, and to prepare transgenic animals, as collis containing the vectors), the encoded polypeptides and antibodies (calls containing the vectors), the encoded polypeptides and antibodies of viral infections or diseases characterized by development of tumours of viral infections or diseases characterized by development of tumours can despend the expression of the nucleotides can be used for diagnosis of these diseases. The nucleotides and polypeptides can so be used to screen for their specific interactive molecules, contentially useful for treating diseases associated with abnormal
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Query Match

                                                       The invention relates to the isolation of 6327 nucleotide sequences, and fragments of at least 15 consecutive nucleotides of these nucleotides, a sequence having at least 80% identity, after optimal alignment, with the currentides, a sequence that hybridizes under stringent conditions with the nucleotides, or the complement, or corresponding RNA, of the nucleotides. The nucleotides are used as probes or primers for detecting, cidentifying, quantifying and/or amplifying nucleic acids, as in vitro corresponding RNA, of the current of the complement, or corresponding RNA, of the current of the complement, or corresponding RNA, of the current of t
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Matches
